Education

Introduction to Computer Science

Jan 2020 – Jan 2021

HarvardX

An online course from Harvard and Yale universities, that introduce computer sciences and web development.

Employment

Full-Stack developer

Jan 2021 – Jan 2023

Free Lancer, Remote

As a full-stack developer, I used to do the design frontend and backend of the project.

I would start by doing a low-fidelity mockup, if this initial mockup went according to the customer's expectations, I would make a high-fidelity mockup where the customer could see exactly what their website would look like.

Then I passed the design to code, making the backend and the frontend using the tools I understand best. Doing this I would create a website responsive to multiple screens, intuitive and easy to use.

I developed REST API'S that received information from the user and stored it in a SQL or NoSQL database.

Frontend Developer

Feb 2023 – Present

Ubiwhere, Aveiro

As a frontend developer at Ubiwhere, I am responsible for developing and maintaining different projects.

The first project involves creating a user-friendly website allowing customers to make boat ride reservations. Using technologies such as React, Next.js, Redux Toolkit, and styled components, I design and implement interactive and responsive user interfaces, ensuring a seamless booking experience for users. I collaborate closely with the design team to ensure the website's visual appeal and optimize its performance. Additionally, I leverage my expertise in HTML, CSS, and GitLab to ensure efficient version control and collaboration within the development team.

In the second project, I manage building a comprehensive back office system for the company. This back office empowers the HR department to manage various aspects, including collaborator salaries, website reservations, and boat ride planning. Utilizing my skills in React, Redux Toolkit, and styled-components, I develop intuitive interfaces and implement robust functionalities that streamline administrative tasks and enhance operational efficiency. With attention to detail and a focus on usability, I work independently to deliver high-quality code and contribute to the project's overall success.

Personal details

Skills

In the third project, I was responsible for initializing the project which included choosing technologies, integrating CI/CD, and implementing a design system. React, RTK Query, Redux Toolkit, Styled Components, and Storybook were chosen technologies. It was also decided to implement unit tests, visual tests, and end-to-end tests, utilizing Jest, React Testing Library, Cypress, and Backstop technologies.

During my tenure, I also worked on a couple more projects where I had to perform and utilize different skills. I successfully refactored legacy code into modern Next.js implementations, resulting in improved maintainability and scalability. My focus on performance optimization led to substantial improvements in page speed, ensuring a smoother user experience. I also implemented SEO best practices, boosting our online visibility and search rankings. Additionally, I played a key role in maintaining existing projects while simultaneously contributing to the development of a comprehensive company design system. This system streamlined our design process and ensured consistency across all digital platforms. My diverse skill set and ability to manage multiple critical initiatives simultaneously demonstrate my value as a versatile and results-driven developer.

Goals

I aim to work with a team of programmers, to continue my learning. Continuing to train myself in new technologies, both backend and frontend.

Move up in my career as a web developer.

About me

I am motivated to learn new technologies;

Organized

Receptive to feedback

I like to work in a team
